

A**Where the benchmark falls on shortfall genes**

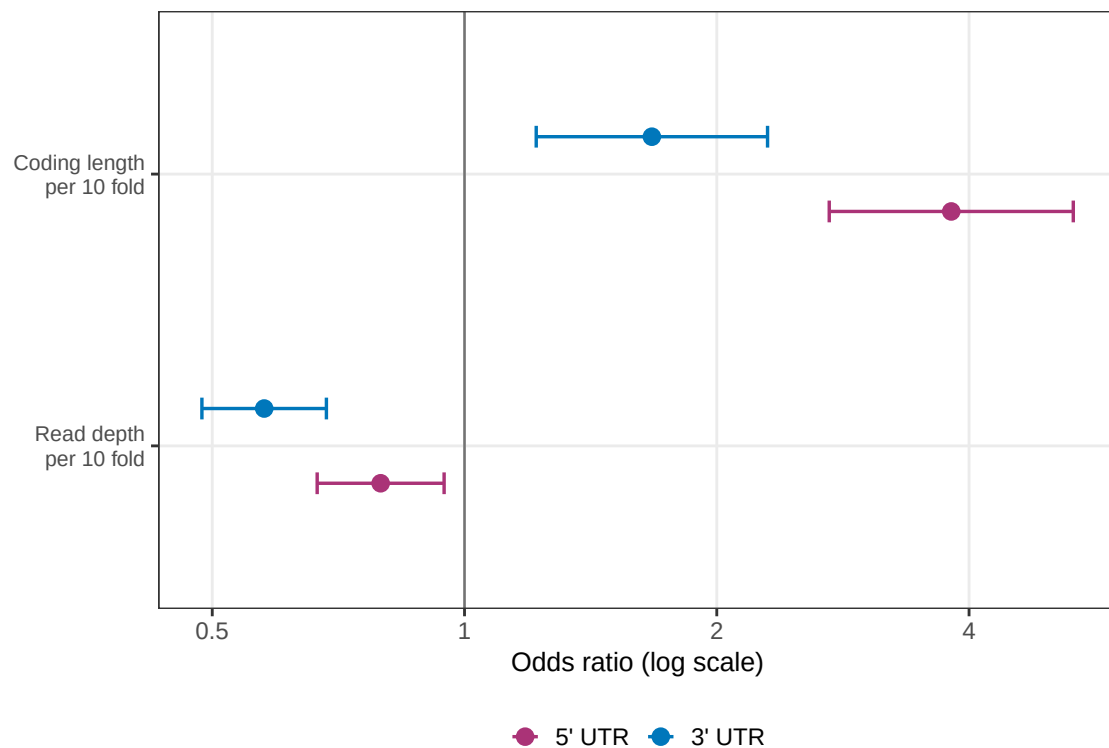

Genes where the DRS call is shorter than the prior reference

**B****The benchmark is not simply preferring the shorter call**

When the DRS call is longer instead, TIF-seq switches sides

**C****The mechanism, from the annotation**

Odds that TIF-seq lies beyond both calls. Steep on size at the 5' end only.

**D****The mechanism, from the alignments**

Reads reaching within 10 nt of the annotated end, by decile of transcript length
